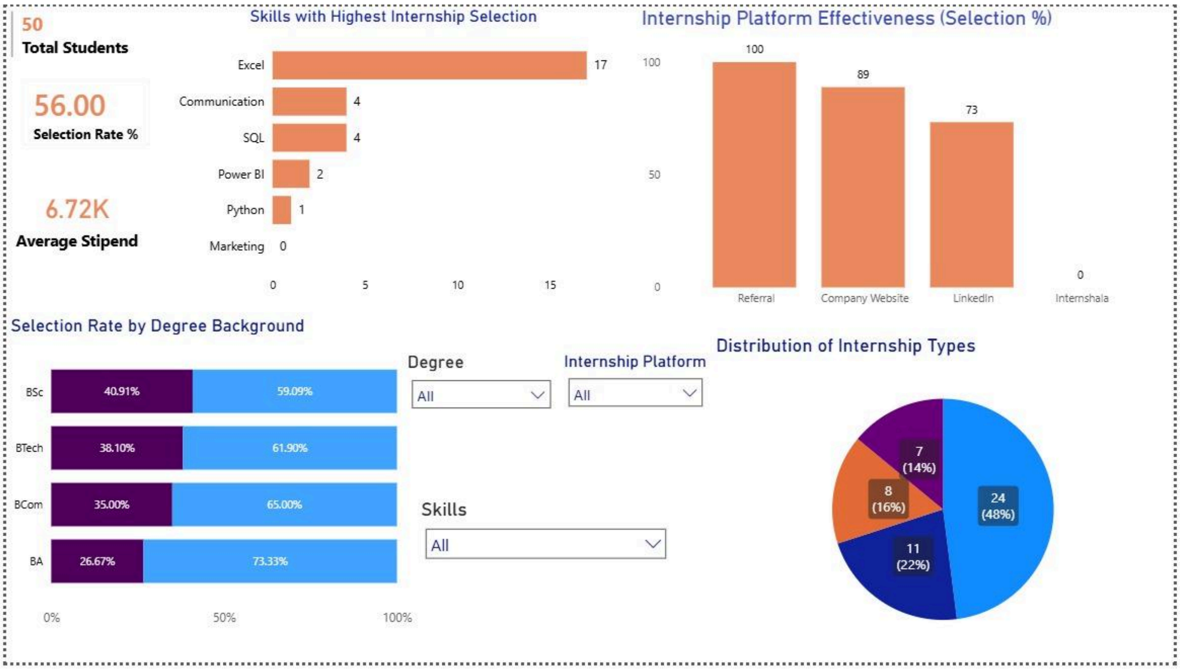
TITLE : **Student Internship Selection & Stipend Analysis using Excel & Power BI**



Project Objective :

•Many students apply for internships but lack clarity on which skills and platforms improve selection chances.
•The goal of this project is to analyze internship data and identify:

-Skills with higher selection rates
-Effective internship platforms
-Factors affecting stipend and selection

Dataset Overview :

•Total students analyzed: 50
•Data fields included:
-Degree background
-Skills
-Internship platform
-Selection status
-Stipend amount
-Internship type

Tools Used :

Microsoft Excel – data cleaning & preparation
Power BI – data modeling, visualization & dashboard creation

Key Analysis Performed :

•Calculated overall selection rate (56%)
• Analyzed average stipend (₹6.7K)
• Compared selection rates by:
  - Skills
  - Degree background
  - Internship platforms

•Created slicers for interactive filtering

- Excel and Communication skills showed the highest internship selection.
- Students applying via Referrals and Company Websites had higher success than other platforms.Certain degree backgrounds showed better selection consistency.
- Skill-based filtering helped identify high-demand skill combinations.

Dashboard Highlights :

- KPI cards for total students, selection rate, and average stipend
- Bar charts showing skills vs selection
- Platform effectiveness comparison
- Interactive slicers for skills and degree background

Conclusion :

This analysis helps students focus on high-impact skills and platforms to improve internship selection chances. It also highlights how skill combinations and application sources influence both selection and stipend outcomes.
